

Dynatrace Davis AI – Complete Guide

What is Davis AI?

Dynatrace **Davis AI** is the core AI engine of Dynatrace used for **monitoring, troubleshooting, and automation** in modern cloud environments.

It continuously analyzes:

- Metrics (CPU, memory, latency)
- Logs
- Distributed traces
- User behavior
- Service dependencies

 It automatically detects problems and identifies the **root cause** without manual intervention.

Core Capabilities

1. Automatic Problem Detection

- Uses AI-based baselines (no manual thresholds)
 - Detects anomalies in real time
 - Example: sudden spike in response time
-

2. Root Cause Analysis (RCA)

- Correlates multiple alerts into a **single problem**
- Identifies the exact root cause

 Reduces alert noise significantly

3. Dependency Mapping (Smartscape)

- Maps relationships between:

- Services
- Containers
- Infrastructure

👉 Helps understand **impact of failures**

🧠 4. Predictive AI

- Forecasts future issues before they occur
 - Examples:
 - CPU will reach 90% soon
 - Disk space running out
-

🔍 5. Causal AI

- Identifies **cause-effect relationships**
- Determines *why* a problem occurred

👉 Example: Deployment caused latency increase

💬 6. Generative AI (Davis CoPilot)

- Allows natural language queries
- Examples:
 - “Why is my app slow?”
 - “Show failed requests”

👉 Provides insights, dashboards, and recommendations

🔧 Real-Time Example (AWS / DevOps)

Scenario:

Application running on **EKS (Kubernetes)** becomes slow.

Without Davis AI:

- Check logs manually
- Check metrics
- Debug services
- Time taken: 30–60 minutes

With Davis AI:

- Detects issue automatically
- Correlates with recent deployment
- Identifies root cause: **Database latency spike**
- Suggests solution: rollback

👉 Resolution time: **minutes**

Hypermodal AI Concept

Davis AI combines multiple AI techniques:

- **Predictive AI** → Forecasts future issues
- **Causal AI** → Identifies root causes
- **Generative AI** → Assists via chat

👉 This combination is called **Hypermodal AI**

Benefits of Davis AI

-  Reduces MTTR (Mean Time to Resolve)
 -  Eliminates alert fatigue
 -  Automates troubleshooting
 -  Works across DevOps, SRE, and Security teams
 -  Improves system reliability
-

Interview-Friendly Definition

“Davis AI is Dynatrace’s AI engine that uses predictive, causal, and generative AI to automatically detect anomalies, identify root causes, and provide actionable insights in modern cloud environments.”
